Solution: Verify the actual solution:

1 Initial condition:

$$y(0) = 4e^0 - 0 - 1 = 3$$

2 The differential equation:

$$\frac{dy}{dt} = 4e^{t} - 1$$

y(t) + t = 4e^{t} - t - 1 + 1 = 4e^{t} - 1

Euler's formula for this problem is

$$y_{n+1} = y_n + h(y_n + t_n)$$

-(20/41)

2

Malthusian Growth Example Example with f(t, y)Numerical Solution of the Lake Problem More Examples Time-varying Population Model

Euler's Method with f(t, y)

Solution (cont): Euler's formula with h = 0.25 is

$y_{n+1} = y_n + 0.25(y_n + t_n)$

Euler's Method with f(t, y)

Solution (cont): Error Analysis

- $y_4 = 7.7656$ corresponds to the approximate solution of y(1)
- The actual solution gives y(1) = 8.87312, so the Euler approximation with this large stepsize is not a very good approximation of the actual solution with a 12.5% error
- If the stepsize is reduced to h = 0.1, then Euler's method requires 10 steps to find an approximate solution for y(1)

(22/41)

Malthusian Growth Example Example with f(t, y)Numerical Solution of the Lake Problem More Examples Time-varying Population Model

Euler's Method with f(t, y)

Solution (cont): Error Analysis

- $y_4 = 7.7656$ corresponds to the approximate solution of y(1)
- The actual solution gives y(1) = 8.87312, so the Euler approximation with this large stepsize is not a very good approximation of the actual solution with a 12.5% error
- If the stepsize is reduced to h = 0.1, then Euler's method requires 10 steps to find an approximate solution for y(1)
- It can be shown that the Euler approximate of y(1), $y_{10} = 8.37497$, which is better, but still has a 5.6% error

-(32/41)

• Determine the percent error between the approximate solution and the actual solution at t = 1

 $\begin{array}{c} \mbox{Malthusian Growth Example} \\ \mbox{Introduction} \\ \mbox{Euler's Method} \\ \mbox{Improved Euler's Method} \\ \mbox{Improved Euler's Method} \\ \mbox{Improved Fuler's Method} \\ \mbox{Improved Fuler's Method} \\ \mbox{Time-varying Population Model} \\ \end{array}$

Time-varying Population Model

Time-varying Population Model: A Malthusian growth model with a time-varying growth rate is

$$\frac{dP}{dt} = (0.2 - 0.02t)P$$
 with $P(0) = 5000$

Skip Example

- With a stepsize of h = 0.2, use Euler's method to approximate P(t) at t = 1
- Show that the actual solution of this problem is

$$P(t) = 5000 \, e^{0.2t - 0.01t^2}$$

- Determine the percent error between the approximate solution and the actual solution at t = 1
- Use the actual solution to find the maximum population of this growth model and when it occurs

- (32/41)

 $\begin{array}{c|c} \mbox{Malthusian Growth Example} \\ \mbox{Introduction} \\ \mbox{Euler's Method} \\ \mbox{Improved Euler's Method} \\ \mbox{Improved Euler's Method} \\ \mbox{Improved Euler's Method} \\ \mbox{More Examples} \\ \mbox{Time-varying Population Model} \\ \end{array}$

Time-varying Population Model

Solution: Euler's formula with h = 0.2 for this example is

$$P_{n+1} = P_n + h(0.2 - 0.02t_n)P_n$$

t_n	P_n
$t_0 = 0$	$P_0 = 5000$
$t_1 = t_0 + h = 0.2$	$P_1 = P_0 + 0.2(0.2 - 0.02t_0)P_0 = 5200$
$t_2 = t_1 + h = 0.4$	$P_2 = P_1 + 0.2(0.2 - 0.02t_1)P_1 = 5403.8$
$t_3 = t_2 + h = 0.6$	$P_3 = P_2 + 0.2(0.2 - 0.02t_2)P_2 = 5611.35$
$t_4 = t_3 + h = 0.8$	$P_4 = P_3 + 0.2(0.2 - 0.02t_3)P_3 = 5822.3$
$t_5 = t_4 + h = 1.0$	$P_5 = P_4 + 0.2(0.2 - 0.02t_4)P_4 = 6036.6$
