Introduction Crow Predation on Whelks Optimal Study Area Chemical Reaction

Introduction

Introduction

- Animals are frequently devising optimal strategies to gain advantage
 - Reproducing more rapidly
 - Better protection from predation
- Primitive animals long ago split into the **prokaryotes** (bacterial cells) and eukaryotes (cells in higher organisms like yeast or humans) from a common ancestor
 - One argument contends that eukaryotic cells added complexity, size, and organization for advantage in competition
 - Prokaryotes stripped down their genome (eliminated junk DNA) to the minimum required for survival, to maximize reproduction

• These arguments suggest that organisms try to optimize

Optimal Solution Chemical Reaction

Derivatives and Graphing

Derivatives and Graphing

- The derivative can find **critical points on graphs**
- Critical points are often local minima or maxima for the function
- This is one application of Calculus, where an **optimal solution** is found

Foraging Strategy

Foraging Strategy

- Whelk Selection
 - Crows search intertidal zone for largest whelks
 - Take whelks to a favorite rocky area
- Flight Strategy
 - Fly to height of about 5 meters
 - Drop whelks on rocks, repeatedly averaging 4 times
 - Eat edible parts when split open
- Can this behavior be explained by an optimal foraging decision process?
- Is the crow exhibiting a behavior that minimizes its expenditure of energy to feed on whelks?

Crow Predation on Whelks Optimal Solution Chemical Reaction Examples

Optimal Foraging Whelk Size Number of Drops as Function of Height Minimize Energy

Optimal Foraging

Optimal Foraging – Northwestern crows (Corvus caurinus) on Mandarte Island

- Reto Zach studied Northwestern crows on Mandarte Island. British Columbia to learn about foraging for whelks (Thais lamellosa)
- Ecologists study these behaviors to give insight into optimal foraging
- Northwestern crows
 - Perch above beaches, then fly to intertidal zone
 - Select largest whelks
 - Fly to the rocky area and drop whelks
 - Eat broken whelks

Why large whelks?

Why large whelks?

- Zach experiment
 - Collected and sorted whelks by size
 - Dropped whelks from various heights until they broke
 - Recorded how many drops at each height were required to break each whelk

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Number of Drops

Zach Observation – Height of the drops and number of drops required for many crows to eat whelks used a marked pole on the beach near a favorite dropping location

Crow Predation on Whelks Optimal Solution Chemical Reaction Examples

Optimal Foraging Whelk Size Number of Drops as Function of Height Minimize Energy

Large Whelks

Large Whelks

- Easier to break open larger whelks, so crows selectively chose the largest available whelks
- There was a gradient of whelk size on the beach, suggesting that the crows' foraging behavior was affecting the distribution of whelks in the intertidal zone, with larger whelks further out
- Crows benefit by selecting the larger ones because they don't need as many drops per whelk, and they gain more energy from consuming a larger one
- Study showed that the whelks broken on the rocks were remarkably similar in size, weighing about 9 grams

Whelk Size

Mathematical Model for Energy Minimize Energy

Optimization Problem

Optimization Problem

- So why do the crows consistently fly to about 5.25 m and use about 4.4 drops to split open a whelk?
- Can this be explained by a mathematical model for minimizing the energy spent, thus supporting an optimal foraging strategy?

Crow Predation on Whelks **Optimal Solution** Optimal Study Area Chemical Reaction Examples

Optimal Foraging Whelk Size Mathematical Model for Energy Number of Drops as Function of Height Minimize Energy

Mathematical Model for Energy

Mathematical Model for Energy

- Energy is directly proportional to the vertical height that an object is lifted (Work put into a system)
- The energy that a crow expends breaking open a whelk
 - The amount of time the crow uses to search for an appropriate whelk
 - The energy in flying to the site where the rocks are
 - The energy required to lift the whelk to a certain height and drop it times the number of vertical flights required to split open the whelk
- Concentrate only on this last component of the problem, as it was observed that the crows kept with the same whelk until they broke it open rather than searching for another whelk when one failed to break after a few attempts

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu) Lecture Notes - Optimization **—** (13/52)

> Crow Predation on Whelks Optimal Solution Optimal Study Area Chemical Reaction Examples

Mathematical Model for Energy Number of Drops as Function of Height Minimize Energy

Mathematical Model for Energy

Fitting the Data – Zach's data on dropping large whelks

H(m)	1.5	2	3	4	5	6	7	8	10	15
N(H)	56	20	10.2	7.6	6	5	4.3	3.8	3.1	2.5

• Since it always requires at least one drop, the proposed function for the number of drops, N, as a function of height, H is

$$N(H) = 1 + \frac{a}{H - h}$$

• The least squares best fit of this function to Zach's data gives a = 15.97 and b = 1.209

Crow Predation on Whelks Optimal Solution Chemical Reaction Examples

Optimal Foraging Whelk Size Mathematical Model for Energy Number of Drops as Function of Height Minimize Energy

Mathematical Model for Energy

Energy Function

• The energy is given by the height (H) times the number of drops (N) or

$$E = kHN$$

where k is a constant of proportionality

• Flying higher and increasing the number of drops both increase the use of energy

(17/52)

Crow Predation on Whelks Optimal Study Area Chemical Reaction Examples

Mathematical Model for Energy Minimize Energy

Mathematical Model for Energy

Minimization Problem – The derivative of the Energy function is

$$E'(H) = k \left(\frac{H^2 - 2bH + b^2 - ab}{(H - b)^2} \right)$$

- The derivative is zero if the numerator is zero
- The numerator is a quadratic with solution

$$H = b + \sqrt{ab} = 1.209 + 4.394$$

- Thus, H = 5.603 is the minimum energy (H = -3.185 is a maximum, but fails to make sense)
- This computed minimum concurs with the experimental observations, suggesting an optimal foraging strategy

Mathematical Model for Energy

Minimization Problem – Energy satisfies

$$E(H) = kH\left(1 + \frac{a}{H - b}\right)$$

- A minimum energy is apparent from the graph with the value around 5.6 m, which is close to the observed value that Zach found the crows to fly when dropping whelks
- The derivative of E(H) is

$$E'(H) = k \left(1 + \frac{a}{H - b} - \frac{aH}{(H - b)^2} \right) = k \left(\frac{H^2 - 2bH + b^2 - ab}{(H - b)^2} \right)$$

• The optimal energy occurs at the minimum, where

$$E'(H) = 0$$

-(18/52)

Optimal Solution Optimal Study Area Chemical Reaction

Optimal Solution

Optimal Solution

- One application of the derivative is to find critical points where often a function has a **relative minimum** or maximum
- An optimal solution for a function is when the function takes on an absolute minimum or maximum over its domain

Definition: An absolute minimum for a function f(x) occurs at a point x = c, if f(c) < f(x) for all x in the domain of f

SDSU

Optimal Solution

Optimal Solution

Theorem: Suppose that f(x) is a continuous, differential function on a closed interval I = [a, b], then f(x) achieves its **absolute minimum** (or maximum) on I and its minimum (or maximum) occurs either at a point where f'(x) = 0 or at one of the endpoints of the interval

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Lecture Notes - Optimization (21/52)

Optimal Solution Optimal Study Area Chemical Reaction

Optimal Study Area

Solution - Optimal Study Area: The Objective Function for this problem is the area of the rectangular plots

The area of each rectangular plot is

$$A(x,y) = xy$$

The optimal solution uses all string

The Constraint Condition is the length of string available

$$P(x,y) = 4x + 3y = 120$$

Optimal Solution Optimal Study Area Chemical Reaction Examples

Optimal Study Area

Optimal Study Area: An ecology student goes into the field with 120 m of string and wants to create two adjacent rectangular study areas with the maximum area possible

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Lecture Notes - Optimization

Optimal Solution Optimal Study Area Chemical Reaction

Optimal Study Area

Solution (cont): This problem allows the objective function of two variables to be reduced by the constraint condition to a function of one variable that can readily be optimized

• The **constraint condition** is solved for y to give

$$y = \frac{120 - 4x}{3}$$

• The objective function becomes

$$A(x) = x \frac{120 - 4x}{3} = 40x - \frac{4x^2}{3}$$

• The **domain** of this function is $x \in [0, 30]$

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu) Lecture Notes - Optimization

Optimal Study Area

Solution (cont): The objective function is a parabola

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Lecture Notes - Optimization

(25/52)

Optimal Solution Chemical Reaction

Chemical Reaction

Chemical Reaction

Chemical Reaction: One of the simplest chemical reactions is the combination of two substances to form a third

$$A + B \xrightarrow{k} X$$

- Assume the initial concentration of substance A is a and the initial concentration of B is b
- The law of mass action gives the following reaction rate

$$R(x) = k(a-x)(b-x), \qquad 0 \le x \le \min(a,b)$$

- k is the rate constant of the reaction and x is the concentration of X during the reaction
- What is the concentration of X where the reaction rate is at a maximum?

Optimal Solution Optimal Study Area Chemical Reaction Examples

Optimal Study Area

Solution (cont): The optimal solution is the maximum area for the function

$$A(x) = 40 \, x - \frac{4 \, x^2}{3}$$

- The maximum area occurs at the vertex of this parabola
- Alternately, we differentiate the objective function with

$$A'(x) = 40 - \frac{8x}{3}$$

- The **critical point** occurs when $A'(x_c) = 0$ or $x_c = 15$
- The maximum area occurs with x = 15 m and y = 20 m
- To maximize the study areas, the ecology student should make each of the two study areas 15 m wide and 20 m long or $A_{max} = 300 \text{ m}^2$

Joseph M. Mahaffy, \(\text{mahaffy@math.sdsu.edu} \)

Crow Predation on Whelks

Optimal Solution Optimal Study Area Lecture Notes - Optimization

-(26/52)

Chemical Reaction

Chemical Reaction: Suppose that $k = 50 \text{ (sec}^{-1}), a = 6$ (ppm), and b=2 (ppm), so

$$R(x) = 50(6-x)(2-x) = 50x^2 - 400x + 600, \quad 0 \le x \le 2$$

• The derivative is

$$R'(x) = 100 x - 400$$

- The critical point (where R'(x) = 0) is $x_c = 4$
- This critical point is outside the domain (and produces a negative reaction rate)
- At the **endpoints**
 - At x = 0, the reaction rate is R(0) = 600 (maximum)
 - At x = 2, the reaction rate is R(2) = 0 (minimum)

SDSU

3

Absolute Extrema of a Polynomial

Solution: The cubic polynomial

$$f(x) = x^3 - 6x^2 + 9x + 4$$

• The derivative is

$$f'(x) = 3x^2 - 12x + 9 = 3(x-1)(x-3)$$

- Critical points occur at $x_c = 1$ and $x_c = 3$
- To find the absolute extrema, we evaluate f(x) at the critical points and the endpoints of the domain
 - f(0) = 4 (an absolute minimum)
 - f(1) = 8 (an relative maximum)
 - f(3) = 4 (an absolute minimum)
 - f(5) = 24 (an absolute maximum)

Absolute Extrema of a Polynomial: Consider the cubic polynomial f(x) defined on the interval $x \in [0, 5]$, where

$$f(x) = x^3 - 6x^2 + 9x + 4$$

Find the absolute extrema of this polynomial on its domain Skip Example

Introduction Optimal Solution Chemical Reaction Examples

Absolute Extrema of a Polynomial Crop Yield Optimal Production of a Pharmaceutical

Crop Yield

Example: Crop Yield The yield of an agricultural crop depends on the nitrogen in the soil

Skip Example

- Crops cannot grow without a source of nitrogen (except many legumes)
- If there is too much nitrogen, it becomes toxic and decreases the yield
- Suppose that the yield of a particular agricultural crop satisfies the function of nitrogen, N (in scaled units)

$$Y(N) = \frac{N}{1 + N^2}$$

• Find the nitrogen level that produces the maximum crop yield

3

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Lecture Notes – Optimization

-(33/52)

Optimal Solution Optimal Study Area Chemical Reaction Examples

Absolute Extrema of a Polynomial Crop Yield Optimal Production of a Pharmaceutical

Crop Yield

Solution: Graph of crop yield function

Crop Yield

Solution: Crop yield for $N \ge 0$ satisfies $Y(N) = \frac{N}{1+N^2}$

• The derivative is

$$Y'(N) = \frac{(1+N^2) - N \cdot 2N}{(1+N^2)^2} = \frac{1-N^2}{(1+N^2)^2}$$

- $Y'(N_c) = 0$ when numerator is zero, so critical points occur at $N_c = -1$ and $N_c = 1$
- Only $N_c = 1$ is in the **domain** with Y(1) = 0.5 being the absolute maximum
- The endpoints are N=0 and $N\to\infty$
 - Y(0) = 0 is an absolute minimum
 - As $N \to \infty$, $Y(N) \to 0$, confirming that we found the absolute maximum

Wire Problem Optimal Production of a Pharmaceutical

Wire Problem

Example: Wire Problem A wire length L is cut to make a circle and a square

Skip Example

How should the cut be made to maximize the area enclosed by the two shapes?

Absolute Extrema of a Polynomial Wire Problem Optimal Production of a Pharmaceutical

Optimal Solution Optimal Study Area Chemical Reaction Examples

Wire Problem Optimal Production of a Pharmaceutical

Wire Problem

Solution: The circle has area πr^2 , and the square has area x^2

The Objective Function to be optimized is

$$A(r,x) = \pi r^2 + x^2$$

The Constraint Condition based on the length of the wire

$$L = 2\pi r + 4x$$

with **domain** $x \in [0, \frac{L}{4}]$

From the constraint, r satisfies

$$r = \frac{L - 4x}{2\pi}$$

5050

2

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Lecture Notes - Optimization

(37/52)

Optimal Solution Optimal Study Area Chemical Reaction Examples

Absolute Extrema of a Polynomial Wire Problem Optimal Production of a Pharmaceutical

Wire Problem

Solution: The relative extremum occurs at

$$x = \frac{L}{4 + \pi}$$

• The second derivative of A(x) is

$$A''(x) = \frac{8}{\pi} + 2 > 0$$

- The function is concave upward, so the **critical point** is a minimum
- \bullet A(x) is a quadratic with the leading coefficient being positive, so the vertex of the parabola is the minimum
- Cutting the wire at $x = \frac{L}{4+\pi}$ gives the minimum possible

Wire Problem

Solution: With the constraint condition, the area function becomes

$$A(x) = \frac{(L-4x)^2}{4\pi} + x^2$$

Differentiating A(x) gives

$$A'(x) = \frac{2(L-4x)(-4)}{4\pi} + 2x = 2\left(\left(\frac{4+\pi}{\pi}\right)x - \frac{L}{\pi}\right)$$

Relative extrema satisfy A'(x) = 0, so

$$(4+\pi)x = L$$

Joseph M. Mahaffy, (mahaffy@math.sdsu.edu)

Lecture Notes - Optimization

Optimal Solution Optimal Study Area Chemical Reaction Examples

Absolute Extrema of a Polynomial Wire Problem Optimal Production of a Pharmaceutical

Wire Problem

Solution: To find the maximum the Theorem for an **Optimal Solution** requires checking the endpoints

- The endpoints
 - All in the circle, x = 0, $A(0) = \frac{L^2}{4\pi}$
 - All in the square, $x = \frac{L}{4}$, $A\left(\frac{L}{4}\right) = \frac{L^2}{16}$
- Since $4\pi < 16$, $A(0) > A(\frac{L}{4})$
- The maximum occurs when the wire is used to create a circle
- Geometrically, a circle is the most efficient conversion of a linear measurement into area

Optimal Study Area Chemical Reaction

Absolute Extrema of a Polynomial Optimal Production of a Pharmaceutical

Optimal Production of a Pharmaceutical

Production of a Pharmaceutical: Suppose the production, Q, depends on the population of the bacteria, B,

$$Q(B) = 2Be^{-0.002B}$$

- Properties of Q(B)
 - Low production for low populations of bacteria
 - High population causes stress, again lowering production
 - Optimal at some intermediate level
- Suppose the population of the bacteria, B, satisfies a logistic growth curve

$$B(t) = \frac{2000}{1 + 99 \, e^{-0.01t}}$$

Optimal Production of a Pharmaceutical

Optimal Production of a Pharmaceutical

- Bacteria often regulate the production of their proteins based on their rate of growth
 - Some proteins are produced in higher quantities during high
 - Others proteins are produced at a higher rate as bacteria enter stress due to limitations in some nutrient
 - In stationary phase, bacteria tend to produce all proteins at a significantly lower rate

Lecture Notes - Optimization

Crow Predation on Whelks **Optimal Solution** Optimal Study Area Chemical Reaction

Absolute Extrema of a Polynomial Optimal Production of a Pharmaceutical

Optimal Production of a Pharmaceutical

Optimization Problem: Find the time when the production, Q, is at a maximum

Solution:

- The production of the pharmaceutical is a function of the population of bacteria, Q(B), (in units of agent), and the population of bacteria is a function of time, B(t) (with time in minutes)
- Must create the composite function Q(B(t)), which is a function that depends on time, t
- The production is at its maximum when $\frac{dQ}{dt} = 0$
- Finding $\frac{dQ}{dt}$ requires the differentiation of a composite function, which uses the chain rule

(44/52)

Optimal Solution Chemical Reaction Examples

Optimal Production of a Pharmaceutical

Chain Rule Problem: The composite function is Q(B(t))with

$$Q(B) = 2Be^{-0.002B}$$
 and $B(t) = \frac{2000}{1 + 99e^{-0.01t}}$

• The **chain rule** for differentiating the composite function is

$$\frac{dQ}{dt} = \frac{dQ}{dB}\frac{dB}{dt} = Q'(B)B'(t)$$

• The **derivative** of Q(B) is

$$Q'(B) = 2e^{-0.002B}(1 - 0.002B)$$

• Notice that this has a maximum at

$$B = 500$$
 with $Q(500) = 1000 e^{-1} = 367.9$
