Polynomial Interpolation Cubic Splines Cubic Splines...

#### **Polynomial Interpolation**

Construct a polynomial passing through the points  $(x_0, f(x_0))$ ,  $(x_1, f(x_1))$ ,  $(x_2, f(x_2))$ , ...,  $(x_N, f(x_n))$ . Define  $L_{n,k}(x)$ , the Lagrange coefficients:

$$\mathbf{L}_{n,k}(\mathbf{x}) = \prod_{i=0, i \neq k}^{n} \frac{\mathbf{x} - \mathbf{x}_{i}}{\mathbf{x}_{k} - \mathbf{x}_{i}} = \frac{x - x_{0}}{x_{k} - x_{0}} \cdots \frac{x - x_{k-1}}{x_{k} - x_{k-1}} \cdot \frac{x - x_{k+1}}{x_{k} - x_{k+1}} \cdots \frac{x - x_{n}}{x_{k} - x_{n}},$$

which have the properties

$$L_{n,k}(x_k) = 1;$$
  $L_{n,k}(x_i) = 0,$  for all  $i \neq k.$ 

We use  $L_{n,k}(x)$ , k = 0, ..., n as building blocks for the *Lagrange interpolating polynomial*:

**Polynomial Interpolation** 

Cubic Splines Cubic Splines...

$$P(x) = \sum_{k=0}^{n} f(x_k) L_{n,k}(x),$$

which has the property

$$P(x_i) = f(x_i), \quad \text{for all } i = 0, \dots, n.$$

This is the unique  $n^{th}$  degree polynomial passing through the points  $(x_i, f(x_i)), i = 0, ..., n$ .

## Combining Taylor and Lagrange Polynomials

A Taylor polynomial of degree n matches the function and its first n derivatives at one point.

A Lagrange polynomial of degree n matches the function values at n + 1 points.

- **Question:** Can we combine the ideas of Taylor and Lagrange to get an interpolating polynomial that matches both the function values and some number of derivatives at multiple points?
- **Answer:** To our euphoric joy, such polynomials exist! They are called *Osculating Polynomials*.

The Concise Oxford Dictionary:

**Osculate 1.** (arch. or joc.) kiss. **2.** (Biol., of species, etc.) be related through intermediate species etc., have common characteristics *with* another or with each other. **3.** (Math., of curve or surface) have contact of higher than first order with, meet at three or more coincident points.

Polynomial Interpolation Checking the Roadmap Cubic Splines Cubic Splines... New Ideas...

Hermite Interpolatory Polynomials

## The Existence Statement

5757

If  $f \in C^1[a, b]$  and  $\{x_0, x_1, \ldots, x_n\} \in [a, b]$  are distinct, the unique polynomial of least degree  $(\leq 2n + 1)$  agreeing with f(x) and f'(x) at  $\{x_0, x_1, \ldots, x_n\}$  is

$$\mathbf{H_{2n+1}}(\mathbf{x}) = \sum_{j=0}^n f(\mathbf{x}_j) \mathbf{H_{n,j}}(\mathbf{x}) + \sum_{j=0}^n f'(\mathbf{x}_j) \hat{\mathbf{H}}_{n,j}(\mathbf{x}),$$

where

 $H_{n,j}(x) = \left[1 - 2(x - x_j)L'_{n,j}(x_j)\right]L^2_{n,j}(x)$  $\hat{H}_{n,j}(x) = (x - x_j)L^2_{n,j}(x),$ 

and  $L_{n,j}(x)$  are our old friends, the *Lagrange coefficients*:

$$L_{n,j}(x) = \prod_{i=0, i \neq j}^{n} \frac{x - x_i}{x_j - x_i}.$$

Further, if  $f \in C^{2n+2}[a, b]$ , then for some  $\xi(x) \in [a, b]$ 

$$f(x) = H_{2n+1}(x) + \frac{\prod_{i=0}^{n} (x - x_i)^2}{(2n+2)!} f^{(2n+2)}(\xi(x)).$$

Polynomial Interpolation Cubic Splines Cubic Splines... Checking the Roadmap Undesirable Side-effects New Ideas...

Osculating Polynomials

## In Painful Generality

Given (n + 1) distinct points  $\{x_0, x_1, \ldots, x_n\} \in [a, b]$ , and non-negative integers  $\{m_0, m_1, \ldots, m_n\}$ .

**Notation:** Let  $m = \max\{m_0, m_1, ..., m_n\}$ .

The osculating polynomial approximation of a function  $f \in C^m[a, b]$  at  $x_i, i = 0, 1, ..., n$  is the polynomial (of lowest possible order) that agrees with

$$\{f(x_i), f'(x_i), \dots, f^{(m_i)}(x_i)\}$$
 at  $x_i \in [a, b], \forall i$ .

The degree of the osculating polynomial is **at most** 

$$M = n + \sum_{i=0}^{n} m_i.$$

In the case where  $m_i = 1$ ,  $\forall i$  the polynomial is called a **Hermite** Interpolatory Polynomial.

Checking the Roadmap

# Checking the Roadmap

Inspired by Weierstrass, we have looked at a number of strategies for approximating arbitrary functions using polynomials.

Taylor	Detailed information from one point, excellent locally, but not very successful for extended intervals.
Lagrange	$\leq$ nth degree poly. interpolating the function in $(n + 1)$ pts. <b>Representation:</b> Theoretical using the Lagrange coefficients $L_{n,k}(x)$
Hermite	$\leq (2n+1)$ th degree polynomial interpolating the function, and matching its first derivative in $(n+1)$ points. <b>Representation:</b> Theoretical using two types of Hermite co- efficients $H_{n,k}(x)$ , and $\hat{H}_{n,k}(x)$

With (n + 1) points, and a uniform matching criteria of m derivatives in each point we can talk about these in terms of the broader class of *osculating polynomials* with:

Taylor(m,n=0), Lagrange(m=0,n), Hermite(m=1,n); with resulting degree  $d \leq (m+1)(n+1) - 1$ .

Poly

## Problems with High Order Polynomial Approximation

We can force a polynomial of high degree to pass through as many points  $(x_i, f(x_i))$  as we like. However, high degree polynomials tend to fluctuate wildly **between** the interpolating points.

## Admiring the Roadmap... Are We Done?

There are many methods (Neville, Newton's divided difference) to produce representations of arbitrary osculating polynomials...

We have swept a dirty little secret under the rug: —

For all these interpolation strategies we get — provided the underlying function is smooth enough, *i.e.*  $f \in C^{(m+1)(n+1)}([a, b])$  — errors of the form

$$\underbrace{\frac{\prod_{i=0}^{n} (x-x_i)^{(m+1)}}{((m+1)(n+1))!}}_{\eta(x)} f^{((m+1)(n+1))}(\xi(x)), \quad \xi(x) \in [a,b]$$

We have seen that with the  $x_i$ 's dispersed (Lagrange / Hermite-style), the controllable part,  $\eta(x)$ , of the error term is better behaved than for Taylor polynomials (but is it well-behaved enough?!) *However*, we have **no** control over the ((n + 1)(m + 1))th derivative of f.

Polynomial Interpolation<br/>Cubic Splines<br/>Cubic Splines...Checking the Roadmap<br/>Undesirable Side-effects<br/>New Ideas...

Alternative Approach to Interpolation

Divide-and-Conquer

The oscillations tend to be extremely bad close to the **end points** of the interval of interest, and (in general) the more points you put in, the wilder the oscillations get!

# Clearly, we need some new tricks!

*Idea:* Divide the interval into smaller sub-intervals, and construct different low degree polynomial approximations (with small oscillations) on the sub-intervals.

This is called *Piecewise Polynomial Approximation*.

Simplest continuous variant: *Piecewise Linear Approximation*:

Polynomial Interpolation Cubic Splines Cubic Splines... New Ideas...

**Piecewise Linear Approximation** 

## 

**Figure:** Piecewise linear approximation of the same data as on slide 13. Is this the end of excessive oscillations?!?

## An Old Idea: Splines

### (Edited for Space, and "Content") Wikipedia Definition: Spline -

A spline consists of a long strip of wood (a lath) fixed in position at a number of points. Shipwrights often used splines to mark the curve of a hull. The lath will take *the shape which minimizes the energy required for bending it between the fixed points*, and thus adopt the smoothest possible shape.

Later craftsmen have made splines out of rubber, steel, and other elastomeric materials.

Spline devices help bend the wood for pianos, violins, violas, etc. The Wright brothers used one to shape the wings of their aircraft.

In 1946 mathematicians started studying the spline shape, and derived the *piecewise polynomial formula known as the spline curve or function*. This has led to the widespread use of such functions in *computer-aided design, especially in the surface designs of vehicles*.

Polynomial Interpolation Cubic Splines Cubic Splines... Checking the Roadmap Undesirable Side-effects New Ideas...

## Problem with Piecewise Linear Approximation

The piecewise linear interpolating function is **not** differentiable at the "nodes," *i.e.* the points  $x_i$ . (Typically we want to do more than just plot the polynomial... and even plotting shows sharp corners!)

Idea: Strengthened by our experience with Hermite polynomials, why not generate piecewise polynomials that match both the function value and some number of derivatives in the nodes!

## The Return of the Cubic Hermite Polynomial!

If, for instance f(x) and f'(x) are known in the nodes, we can use a collection of *cubic Hermite polynomials*  $H_j^3(x)$  to build up such a function.

But... what if f'(x) is **not** known (in general getting measurements of the derivative of a physical process is much more difficult and unreliable than measuring the quantity itself), can we still generate an interpolant with continuous derivative(s)???

## Modern Spline Construction: — A Model Railroad

Given a function f defined on [a, b] and a set of nodes  $a = x_0 < x_1 < \cdots < x_n = b$ , a **cubic spline interpolant** S for f is a function that satisfies the following conditions:

**a.** S(x) is a cubic polynomial, denoted  $S_j(x)$ , on the sub-interval  $[x_j, x_{j+1}] \forall j = 0, 1, ..., n-1.$ 

**b.** 
$$S_j(x_j) = f(x_j), \ \forall j = 0, 1, ..., (n-1).$$
 "Left" Interpolation

c. 
$$S_j(x_{j+1}) = f(x_{j+1}), \ \forall j = 0, 1, \dots, (n-1).$$
  
d.  $S'_j(x_{j+1}) = S'_{j+1}(x_{j+1}), \ \forall j = 0, 1, \dots, (n-2).$   
Slope-match

e. 
$$S''_{j}(x_{j+1}) = S''_{j+1}(x_{j+1}), \ \forall j = 0, 1, \dots, (n-2).$$
 Curvature-match

The spline segment  $S_j(x)$  "lives" on the interval  $[x_j, x_{j+1}]$ . The spline segment  $S_{j+1}(x)$  "lives" on the interval  $[x_{j+1}, x_{j+2}]$ .

Their function values:  $S_j(x_{j+1}) = S_{j+1}(x_{j+1}) = f(x_{j+1})$ derivatives:  $S'_j(x_{j+1}) = S'_{j+1}(x_{j+1})$ and second derivatives:  $S''_j(x_{j+1}) = S''_{j+1}(x_{j+1})$ 

... are required to match in the *interior* point  $x_{i+1}$ .

Polynomial Interpolation<br/>Cubic Splines<br/>Cubic Splines...Introduction<br/>Building the Spline Segments<br/>Associated Linear SystemsBuilding Cubic Splines, I. — Applying the Conditions

We start with

$$S_j(x) = a_j + b_j(x - x_j) + c_j(x - x_j)^2 + d_j(x - x_j)^3$$
  
$$\forall j \in \{0, 1, \dots, n - 1\}$$

and apply all the conditions to these polynomials...

For convenience we introduce the notation  $h_j = x_{j+1} - x_j$ .

- **b.**  $S_j(x_j) = a_j = f(x_j)$
- c.  $S_{j+1}(x_{j+1}) = \mathbf{a_{j+1}} = \mathbf{a_j} + \mathbf{b_j h_j} + \mathbf{c_j h_j^2} + \mathbf{d_j h_j^3} = S_j(x_{j+1})$
- **d.** Notice  $S'_j(x_j) = b_j$ , hence we get  $\mathbf{b_{j+1} = b_j + 2c_jh_j + 3d_jh_j^2}$
- **e.** Notice  $S''_j(x_j) = 2c_j$ , hence we get  $\mathbf{c_{j+1}} = \mathbf{c_j} + \mathbf{3d_jh_j}$ .
- We got a whole lot of equations to solve!!! (How many???)

Polynomial Interpolation Cubic Splines Cubic Splines... Associated Linear Systems

## Cubic Splines, II. — Solving the Resulting Equations.

We solve [e] for 
$$d_j = \frac{c_{j+1} - c_j}{3h_j}$$
, and plug into [c] and [d] to get  
[c']  $a_{j+1} = a_j + b_j h_j + \frac{h_j^2}{3}(2c_j + c_{j+1}),$   
[d']  $b_{j+1} = b_j + h_j(c_j + c_{j+1}).$   
We solve for  $b_j$  in [c'] and get  
[\*]  $b_j = \frac{1}{1}(a_{j+1} - a_j) - \frac{h_j}{2}(2c_j + c_{j+1}).$ 

$$[*] b_j = \frac{1}{h_j}(a_{j+1} - a_j) - \frac{n_j}{3}(2c_j + c_{j+1})$$

Reduce the index by 1, to get

[\*'] 
$$b_{j-1} = \frac{1}{h_{j-1}}(a_j - a_{j-1}) - \frac{h_{j-1}}{3}(2c_{j-1} + c_j).$$

Plug [\*] (lhs) and [\*'] (rhs) into the index-reduced-by-1 version of [d'], *i.e.* 

$$[\mathbf{d}^n] \ b_j = b_{j-1} + h_{j-1}(c_{j-1} + c_j).$$

## Cubic Splines, III. — A Linear System of Equations

After some "massaging" we end up with the linear system of equations for  $j \in \{1, 2, ..., n-1\}$  (the interior nodes).

$$h_{j-1}c_{j-1} + 2(h_{j-1} + h_j)c_j + h_jc_{j+1} = \frac{3}{h_j}(a_{j+1} - a_j) - \frac{3}{h_{j-1}}(a_j - a_{j-1}).$$

**Notice:** The only unknowns are  $\{c_j\}_{j=0}^n$ , since the values of  $\{a_j\}_{j=0}^n$  and  $\{h_j\}_{j=0}^{n-1}$  are given.

Once we compute  $\{c_j\}_{j=0}^{n-1}$ , we get

$$b_j = \frac{a_{j+1} - a_j}{h_j} - \frac{h_j(2c_j + c_{j+1})}{3}$$
, and  $d_j = \frac{c_{j+1} - c_j}{3h_j}$ .

We are **almost** ready to solve for the coefficients  $\{c_j\}_{j=0}^{n-1}$ , but we only have (n-1) equations for (n+1) unknowns...

#### Joseph M. Mahaffy, $\langle jmahaffy@mail.sdsu.edu \rangle$ (25/48)

We can complete the system in many ways, some common ones are...

# **Clamped boundary conditions:** (Derivative known at endpoints).

 $[c1] S'_0(x_0) = b_0 = f'(x_0)$  $[c2] S'_{n-1}(x_n) = b_n = b_{n-1} + h_{n-1}(c_{n-1} + c_n) = f'(x_n)$ 

[c1] and [c2] give the additional equations

$$\begin{bmatrix} \mathbf{c1'} \end{bmatrix} \qquad 2h_0c_0 + h_0c_1 = \frac{3}{h_0}(a_1 - a_0) - 3f'(x_0) \\ \begin{bmatrix} \mathbf{c2'} \end{bmatrix} \qquad h_{n-1}c_{n-1} + 2h_{n-1}c_n = 3f'(x_n) - \frac{3}{h_{n-1}}(a_n - a_{n-1}).$$

Cubic Splines, IV. — Completing the System

We can complete the system in many ways, some common ones are...

Natural boundary conditions:

Joseph M. Mahaffy, (jmahaffy@mail.sdsu.edu)

$$\begin{bmatrix} \mathbf{n1} \end{bmatrix} \quad 0 = S_0''(x_0) = 2c_0 \quad \Rightarrow \quad c_0 = 0$$
$$\begin{bmatrix} \mathbf{n2} \end{bmatrix} \quad 0 = S_n''(x_n) = 2c_n \quad \Rightarrow \quad c_n = 0$$

Introduction Building the Spline Segments Associated Linear Systems

# Cubic Spline Natural B.C.

Introduction Building the Spline Segments Associated Linear Systems

# Cubic Spline Natural B.C.

Cubic Spline with Natural boundary conditions

We end up with a linear system of equations,  $A\tilde{\mathbf{x}} = \tilde{\mathbf{y}}$ , where

$$\tilde{\mathbf{y}} = \begin{bmatrix} \frac{3(\mathbf{a}_1 - \mathbf{a}_0)}{\mathbf{h}_0} - 3\mathbf{f}'(\mathbf{x}_0) \\ \frac{3(a_2 - a_1)}{h_1} - \frac{3(a_1 - a_0)}{h_0} \\ \vdots \\ \frac{3(a_n - a_{n-1})}{h_{n-1}} - \frac{3(a_{n-1} - a_{n-2})}{h_{n-2}} \\ 3\mathbf{f}'(\mathbf{x}_n) - \frac{3(\mathbf{a}_n - \mathbf{a}_{n-1})}{h_{n-1}} \end{bmatrix}, \quad \tilde{\mathbf{x}} = \begin{bmatrix} c_0 \\ c_1 \\ \vdots \\ c_{n-1} \\ c_n \end{bmatrix}$$

Boundary Terms: marked in red-bold.

**MatLab code changes** for a cubic spline with Clamped Boundary conditions.

- 1 % Cubic Spline Interpolation Clamped
- 2 % INPUT: xi is the grid (points on x-axis) and a ... are points on y-axis. inter
- 3 % is the point on the x-axis you want to know the ... value of on the y-axis.
- 4
- 5 function [P] = cubic\_splineclp(xi,a,fp)

No numerical story is complete without an error bound... If  $f \in C^4[a, b]$ , let

$$M = \max_{a \le x \le b} |f^4(x)|.$$

## If S is the unique **clamped cubic spline interpolant** to f with respect to the nodes $a = x_0 < x_1 < \cdots < x_n = b$ , then with

$$h = \max_{0 \le j \le n-1} (x_{j+1} - x_j) = \max_{0 \le j \le n-1} h_j$$

$$\max_{a \le x \le b} |f(x) - S(x)| \le \frac{5Mh^4}{384}$$

We notice that the linear systems for both natural and clamped boundary conditions give rise to *tri-diagonal linear systems*.

Further, these systems are *strictly diagonally dominant* — the entries on the diagonal outweigh the sum of the off-diagonal elements (in absolute terms) —, so pivoting (re-arrangement to avoid division by a small number) is not needed when solving for  $\tilde{\mathbf{x}}$  using Gaussian Elimination...

This means that these systems can be solved very quickly (we will revisit this topic later on, but for now the algorithm is on the next couple of slides), see also "Computational Linear Algebra / Numerical Matrix Analysis."<sup>Math 543</sup>

It is more efficient to store our matrix A as only 3 vectors for large A

Below is a more efficient way to store and solve a **Tridiagonal matrix**, assuming it is tridiagonal

```
1 function y = tridiag( a, b, c, f )
2
3 % Solve the n x n tridiagonal system Ay = f ...
for y
4 % with diagonal a, subdiagonal b, and ...
superdiagonal c
5 % f must be a vector (row or column) of length n
6 % a, b, c must be vectors of length n
7 % (note that b(1) and c(n) are not used)
```

Below is the main code for solving a **Tridiagonal matrix**, assuming it is tridiagonal

20	n = length(f);
21	v = zeros(n, 1);
22	y = v;
23	w = a(1);
24	y(1) = f(1)/w;
25	<pre>for i=2:n</pre>
26	v(i-1) = c(i-1)/w;
27	w = a(i) - b(i) * v(i-1);
28	y(i) = (f(i) - b(i)*y(i-1))/w;
29	end
30	<b>for</b> j=n-1:-1:1
31	y(j) = y(j) - v(j)*y(j+1);
32	end
